

ORGIQ • AI-POWERED ORG ANALYSIS

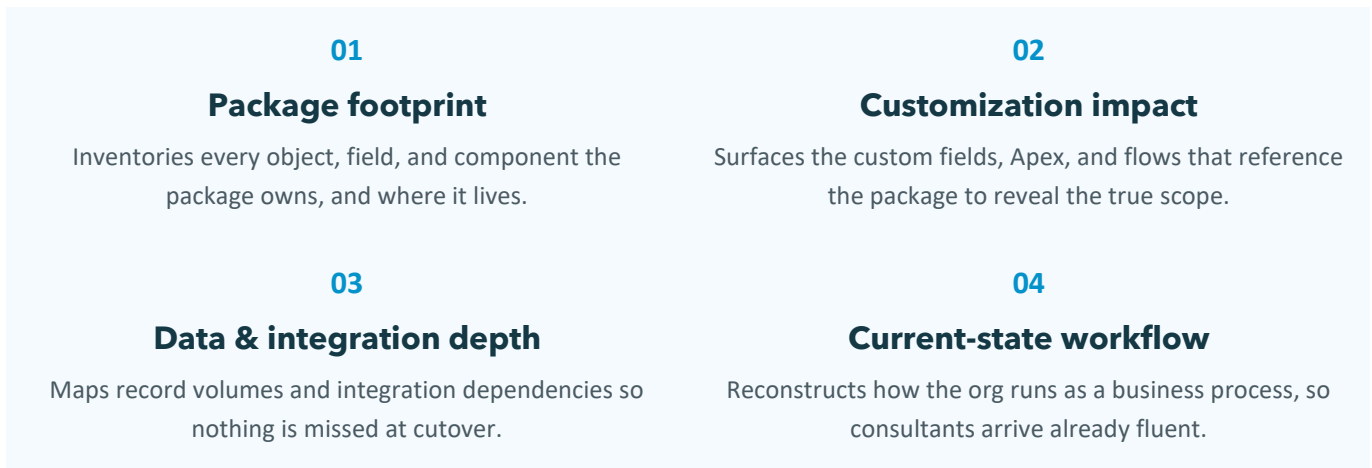

See the whole org before you migrate a single component.

OrgIQ is ForeFront's managed package analyzer, an AI-driven deep scan that maps everything a managed package touches in your Salesforce org in minutes, not weeks. It turns notoriously slow, manual discovery into a fast, structured baseline so your migration starts from clarity, not guesswork.

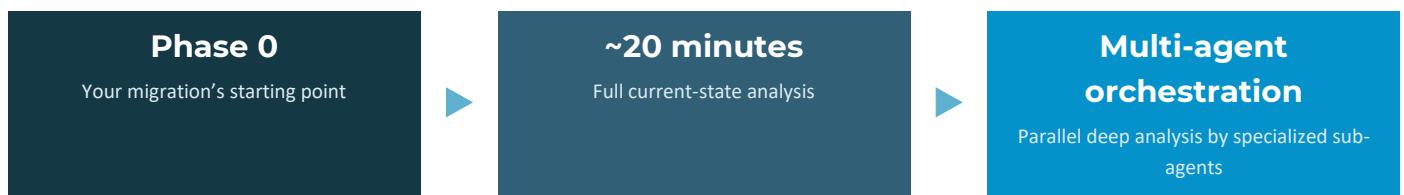

THE CHALLENGE

Migrating off a managed package means untangling years of customization built on top of it, whether you are moving CPQ to Agentforce Revenue Management (ARM), ServiceMax to Field Service, or making any package-to-standard move. Understanding that landscape can consume weeks of discovery before anyone can scope the work. OrgIQ compresses that to a single first step.

WHAT ORGIQ ANALYZES

HOW THE ANALYSIS RUNS

Applies to any package-to-standard migration: CPQ → ARM, ServiceMax → Field Service, Commerce packages and more. A low-cost, high-value discovery activity that produces engagement-ready output.

THE MOST IMPORTANT PART

AI accelerates the analysis. People make the decisions.

OrgIQ does not replace human interpretation. That is where the real value lives. The tool produces a fast, accurate picture of the current state and where complexity and customization may add effort; it does **not** map old functionality to new, design the target solution, or decide how to implement it. ForeFront's architects and consultants read the output, apply judgment, and shape the transformation.

The result: discovery is future-state focused from day one. Instead of spending stakeholder time asking "what do you do today," we arrive already fluent, and spend the conversation on where you're going.

WHAT YOU GET

- **Complexity & risk read-out**

Where the package is used, how deeply it's customized, and where migration effort will concentrate.

- **A prescriptive point of view**

A clear ForeFront perspective on approach: what to preserve, reroute, and defer.

- **Informed migration scope**

Current-state baseline that shapes engagement size, timeline, and the discovery agenda.

- **A current-state workflow**

The business process behind the metadata, ready to align on before discovery begins.

HOW IT WORKS

1. **Provide sandbox access**

A full sandbox that mirrors production, the only prerequisite to get started.

2. **Run the analysis**

OrgIQ scans the org in ~20 minutes and produces the current-state read-out.

3. **Align, then discover**

We review the output with you, confirm the baseline, and move straight into future-state discovery.

A low-cost, high-value first step that grounds every migration engagement in evidence, so scope, timeline, and effort are shaped by what's really in the org, not by assumptions.

GET STARTED

Start every managed package migration from clarity.
